

## Bug 1 — PostgreSQL authentication failure

**Location:** `pg_hba.conf`

**Problem:**

PostgreSQL was configured to use `ident` authentication for the relevant connections, so the Auth service could not authenticate using the password configured in `.env`.

**Fix:**

Changed the relevant `host` entries in `pg_hba.conf` from `ident` to `md5`.

---

## Bug 2 — PostgreSQL password mismatch

**Location:** PostgreSQL `eventhub` user / Auth service `.env`

**Problem:**

The password configured for the `eventhub` PostgreSQL user did not match the password configured in `.env`.

**Fix:**

Updated the PostgreSQL user's password using `ALTER USER` so it matched the application configuration.

---

## Bug 3 — PostgreSQL schema permission denied

**Location:** PostgreSQL `public` schema

**Problem:**

The `eventhub` user did not have the required permissions on the `public` schema.

**Fix:**

Granted the required privileges on the `public` schema to the `eventhub` user.

---

## Bug 4 — Booking service Python dependency incompatibility

**Location:** `services/booking-service-python/requirements.txt`

**Problem:**

The service pins `pydantic==2.7.1`, which depends on `pydantic-core==2.18.2`. The project did not specify a required Python version, while my machine was using Python 3.14.6. Installing the requirements resulted in a dependency compatibility problem.

**Fix:**

Used a Python version compatible with the pinned project dependencies.

---

## Bug 5 — MongoDB version incompatibility

**Location:** MongoDB installation / system environment

**Problem:**

MongoDB 8.0.28 failed to start because of incompatibility with the Linux kernel version on the machine.

**Fix:**

Installed MongoDB 7.0, which was compatible with the environment.

---

## Bug 6 — Legacy Catalog `/health` endpoint

**Location:** `services/legacy-catalog-java`

**Problem:**

`GET /health` returned `404 Not Found`, although the API contract specifies that it should return `{"status": "ok"}`.
