

Labs

Instructions:

1. Login to killercoda using your gmail account.
2. Choose kubernetes playground.

<https://killercoda.com/playgrounds/scenario/kubernetes>

Chapter 4:

1. Clone the below repo from github using the below command.

- **git clone <https://github.com/marwaahmed11/PodmanLabs.git>**

then, you will find the below files inside PodmanLabs

```
|-- Containerfile
|-- package.json
|-- run-container.js
|-- server.js
```

2. Build a container image tagged hello-server:bad by using the Containerfile you created.
3. Create a container called hello-bad that uses the hello-server:bad image and binds the container port 3000 to the host port 3000.
4. Make a request to the running container by using the curl command.
5. Stop the hello-bad container.
6. Inspect the number of image layers in the hello-server:bad image.
7. Open the Containerfile that you created and refactor the file to use a WORKDIR instruction.
 - Update the paths in the rest of the file to match.
 - Merging the RUN instructions into a single instruction.
9. Build the container image by using the updated Containerfile. Use the hello-server:better image tag.
10. Inspect the number of image layers in the hello-server:better image.
