

Labs

Instructions:

1. Login to killercoda using your gmail account.
2. Choose kubernetes playground.
<https://killercoda.com/playgrounds/scenario/kubernetes>

Chapter 6:

1. Create a container named “**web1**” in the background using **registry.access.redhat.com/ubi8/httpd-24:latest** image.
2. Try to curl from the host. Does it work? And why?
3. Troubleshoot the issue addressed in question 2.
4. Create another container named “**web3**” in the background using **registry.access.redhat.com/ubi8/httpd-24:latest** image and route traffic from port 8082 on your machine to port 8080 inside of the container.
5. Test the connectivity from web2 container to web3 container. It will fail.
6. Troubleshoot why the connectivity from web1 container to web2 container failed.
7. Create a network named “**mynet**”.
8. Attach web2 and web3 containers to mynet network.
9. Test the connectivity from web2 container to web3 container. Does it work?
10. Create a container named “my_sql” in the background using the mysql:8.0 image. Then check the container status. You will find the container in exit state.
11. Troubleshoot why the my_sql container exited and try to start it.
